

General Description

The DS1925EVKIT is a Thermochron iButton® starter kit that provides the basic hardware for a quick evaluation of Maxim's Thermochron iButton family that communicates using the 1-Wire protocol. The kit uses a USB port of a PC running Windows® operation system. The kit includes DS1925L Thermochron iButton and all the hardware required to communicate with it. The DS1925L is a high-capacity Thermochron capable of 122K 8-bit readings or 61K 16-bit readings taken at equal distances. The easy setup process includes the free downloadable 1-Wire® drivers and the OneWireViewer demonstration software to communicate easily with iButtons through the PC's USB port. Visit the [download site](#) for the free 1-Wire drivers and bundled OneWireViewer.

For developers who wish to create custom iButton ecosystems, Maxim provides iButton design resources with links for software resources and iButton accessories found [here](#).

Benefits and Features

- Starter Kit Evaluates the DS1925L Thermochron iButton Temperature Recording Device with a Microsoft Windows-Based PC
- Easy Setup with USB Adapter
- Free Download of 1-Wire Drivers and OneWireViewer Demonstration Software
- Compatible with Other Thermochron iButtons: DS1921, DS1922L, DS1922T, DS1922E, and DS1923 (Not Included)

[Ordering Information](#) appears at end of data sheet.

Quick Start

To download the 1-Wire drivers software package, visit the [1-Wire Drivers](#) page and click the button that takes you to the **Download Page**. Select the applicable version of the Windows operating system and select the file that corresponds to your PC's configuration (e.g., 32-bit 1-Wire drivers or 64-bit 1-Wire drivers) and then click the **Download** button. The web page provides assistance on how to detect whether your PC runs a 32-bit or 64-bit operating system.

- 1) Double click on the file you just downloaded (**install_1_wire_drivers_x64_v405.msi** or newer).
- 2) Select **Run** when prompted with the question "Do you want to run or save this file?"
- 3) The welcome setup wizard box opens for the OneWireDrivers Setup. Click the **Next** button.
- 4) Read and check the box if you accept the license agreement. Click **Next**.
- 5) Leave the destination folder to default and click **Next**.
- 6) Make sure DS9490R is unplugged and click **Install**. If asked the question "Would you like to install this device software?" click **Install**.
- 7) Click the **Finish** button to exit the **Setup Wizard**.
- 8) After running the 1-Wire installation wizard, make sure internet is available and plug the DS9490R USB adapter in to a free USB port in your PC.
- 9) Plug the RJ-11 Modular connector of the DS1402D-DR8 Blue Dot Receptor into the DS9490R USB adapter.
- 10) Optionally snap the iButton into the key fob. This makes easier removal of the iButton from the Blue Dot Receptor. **Note:** For easier installation, place the key fob in warm water prior to inserting the iButton. The warm moisture helps the key fob slide on easier to the iButton.
- 11) Go to the Start menu under **All Programs** and select the folder 1-Wire Drivers x64. Select the **Default 1-Wire Net.exe** program. When the program window appears click on **Auto Detect**. The program finds which USB port the DS9490R occupies. If prompted by another window, click **Yes** to set as the new default port. Exit the program.

- 12) Go to the **Start** menu and click on **OneWireViewer.exe** icon. This application can also be found under the Start menu folder "1-Wire Drivers x64" that was used previously.
- 13) Snap the iButton (optionally with key fob) into the Blue Dot Receptor to display its address. Click on the address to access screens that show all the functions of each iButton. Then follow the instructions for missioning and reading the contents of a Thermochron.

For more details on using the OneWireViewer, see Application Note 4373: OneWireViewer and iButton Quick Start Guide and Application Note 3358: OneWireViewer User's Guide

Detailed Description of Software

For developing applications for the DS1925 Thermochron, Maxim offers three software development kits (SDKs):

1-Wire API for Java (OWAPI support). This is the foundation for developing robust 1-Wire and iButton software on platforms that have a Java Virtual Machine. It includes the above-mentioned OneWireViewer utility and its Java source code. In other words, this provides support for the 1-Wire link primitives, 1-Wire network, transport memory byte read/write, transport memory packet read/write and the 1-Wire files structure, which is the full list of support for DS1925. Download here:

https://www.maximintegrated.com/en/products/ibutton/software/1wire/1wire_api.cfm

1-Wire SDK for Windows (TMEX support). This SDK is aimed primarily at PC host environments running Microsoft Windows. This provides support for only the 1-Wire link primitives and the 1-Wire network of DS1925. Download here:

<https://www.maximintegrated.com/en/products/ibutton/software/windowsdk/index.cfm>

1-Wire Public Domain Kit. This SDK is aimed as a cross-platform API. This provides support for only the 1-Wire link primitives and the 1-Wire network of DS1925. Download here:
